

Groups & layers in UXBOX

Groups and layers are a standard functionality easy to use. At the "Layers" window you can edit, delete, group and order the shapes. As soon as you create a shape like a box, a circle, a line, ... it will be represented at the layers window.

Show/hide current shape or group

Lock/unlock current shape or group

Show/hide group content

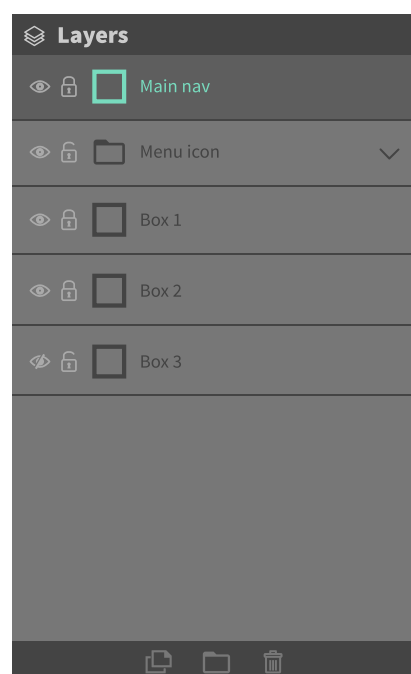

Group/ungroup selected shapes

Duplicate shape or group

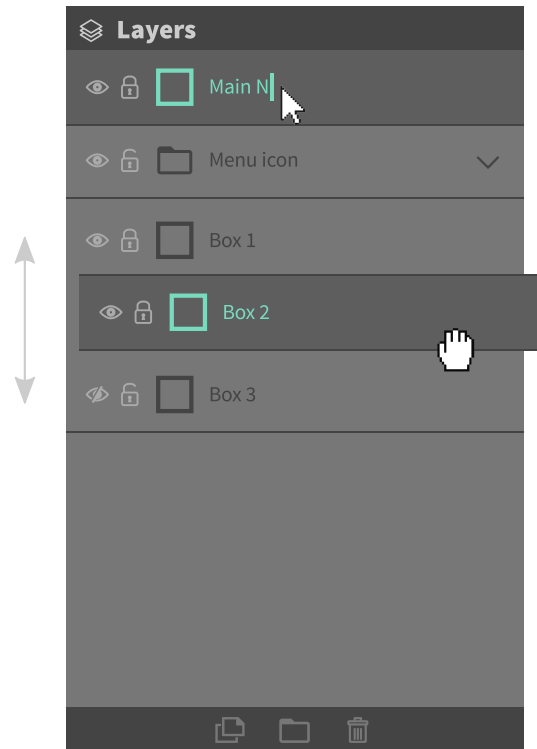

Delete shape or group

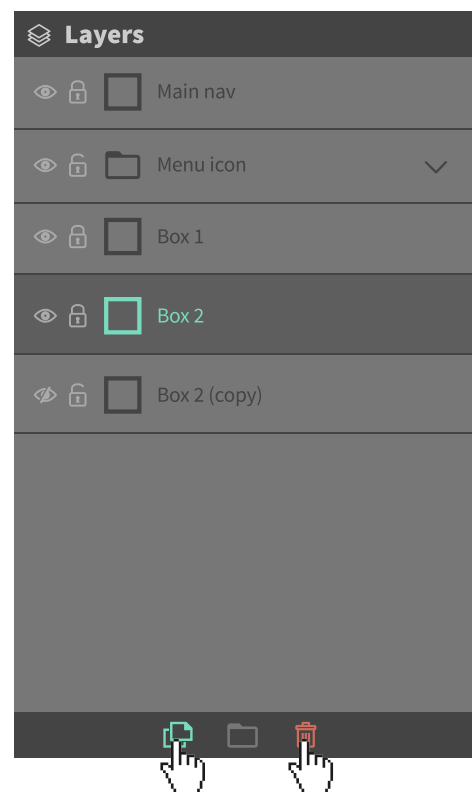

You can organize a shape/group order by drag & drop them in the layers window.

Also you can rename the shapes/groups. Do mouseover on the name and change it.

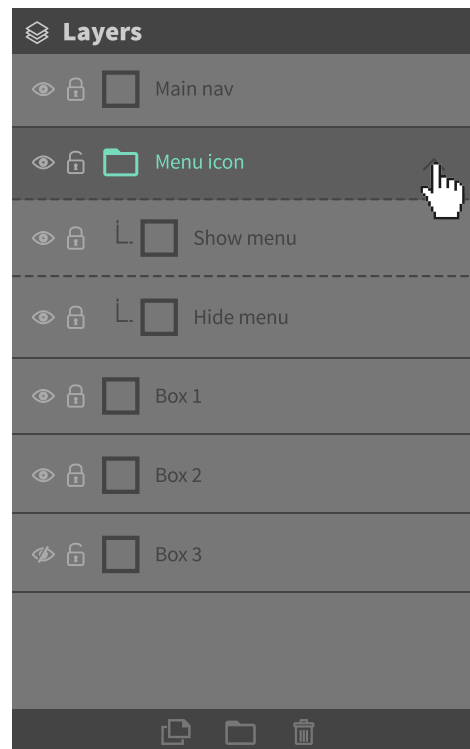

At the bottom of the layers window you have an interaction bar with 3 options: duplicate, group/ungroup and delete shapes/groups.

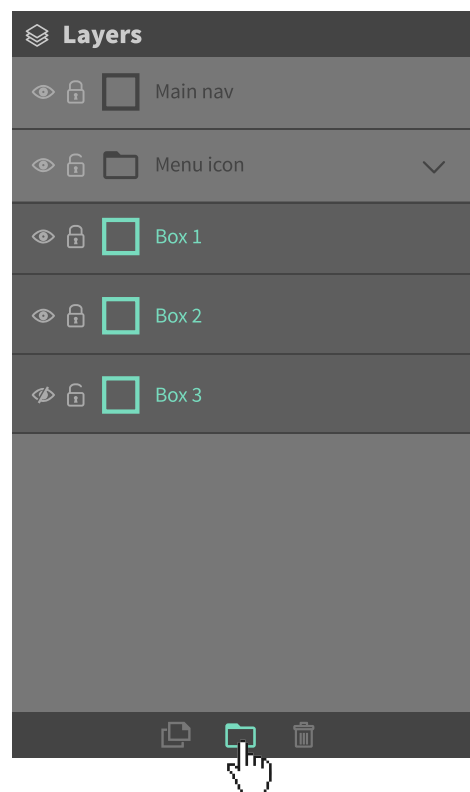

Click on the toggle icon to show the shapes/groups inside the group.

Groups allows you to move, align and organize multiple shapes together.

Select multiple shapes and click on the folder icon to create a new group with them inside.

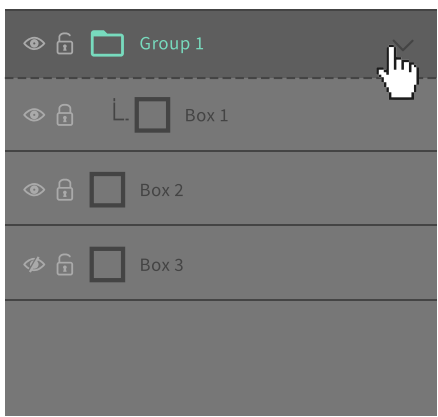

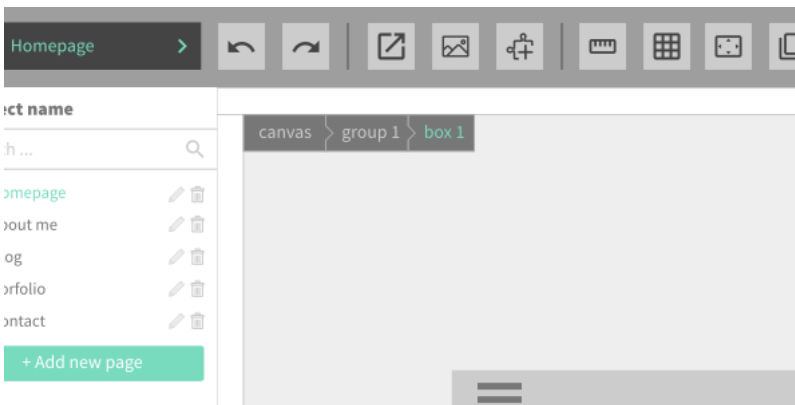

You can create an empty group too. Click on the folder icon without shape/group selected.

Groups breadcrumb

Once you select a group at the canvas or at the layers window the group breadcrumb will appear at the top-left corner of the canvas.

It allows you to navigate easily between the group elements inside it. You can go back to the canvas level in one click.

You can select any other shape/group inside from the breadcrumb. Navigate through it and click on the element you want to edit.
