## UXBOX and multi-canvas

UXBOX uses pages to organize your projects. Sometimes work with all pages at the same time is useful to have a better feeling about the overall project interactions and fine tuning. Now you have multi-canvas feature in UXBOX.

Multi-canvas view

At UXBOX workspace you can find de multi-canvas toggle icon. Click on it to change the normal page view to the multi-canvas view to start working on all the project's pages at the same time. It is perfect when you need to have an overall project status.

As default, when you enter on the multi-canvas view your work will be focused on the last page you came from. That means that the layers and all the changes you make will be done on this page.

If you want to change between pages you only have to click on the canvas you want to work on. All layers and settings will be changed automatically.

Your project's pages will have the same canvas size by default. You configured it when yoy create your project. But, what happend if I whant to have multiple canvas sizes in my project? Maybe to design a mobile version or an icon set inside your current project...
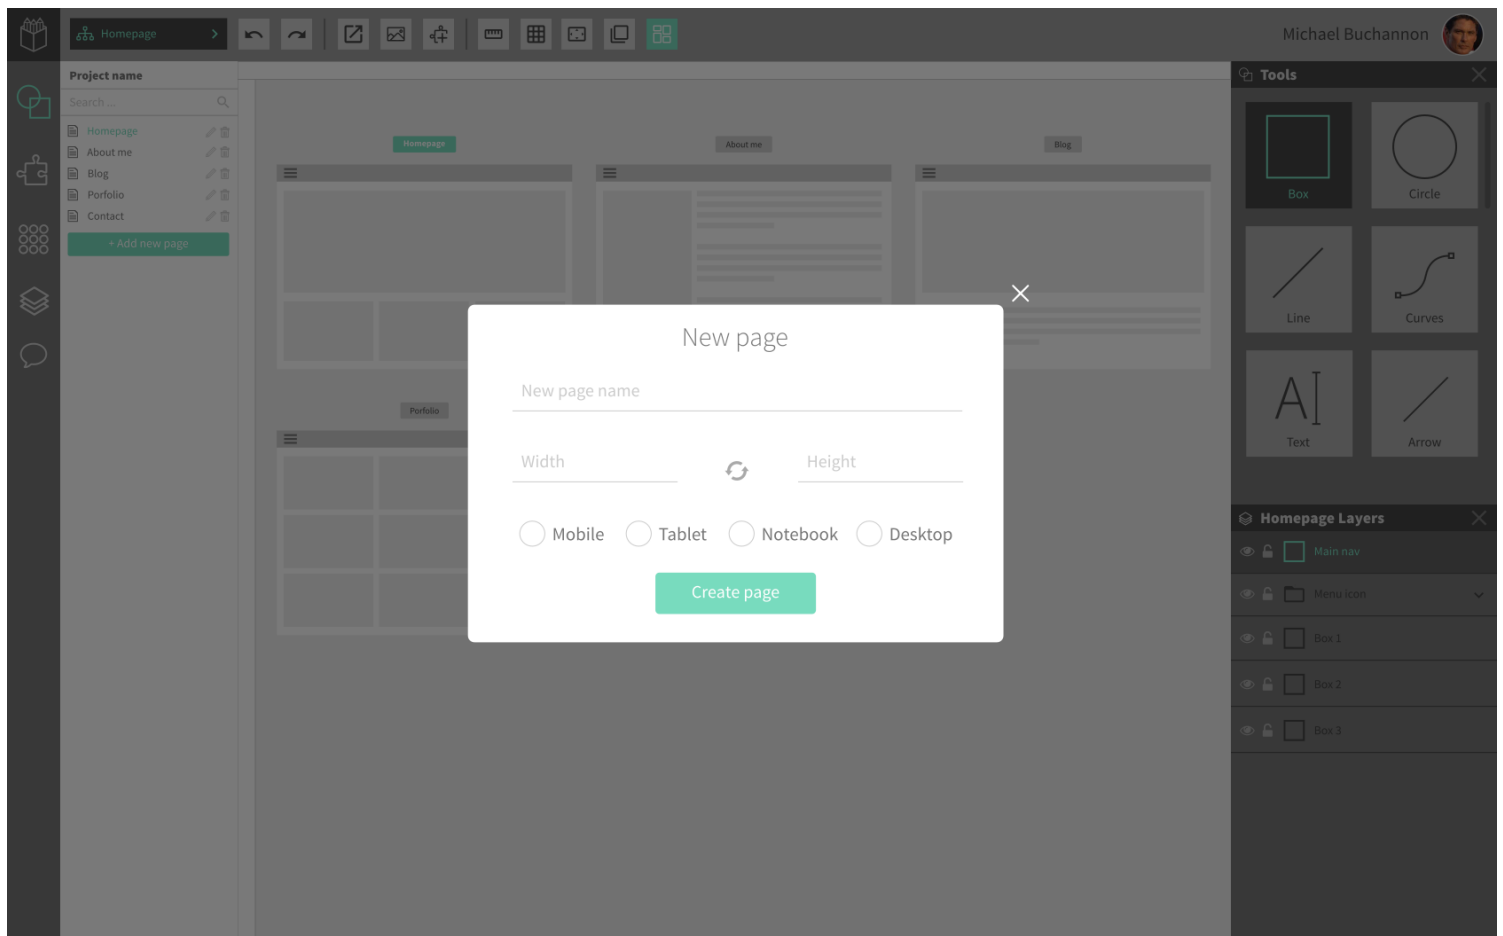

Easy! When you create/edit a page will be appear a lightbox with all the settings you need. Enter or correct the sizes, name you want and thats all!

Multi-canvas different sizes

Once you have your wireframe/design done probably you want adapt it for differents displays. Go to the page manage panel and click in "add new page" or edit the current page.

Then will appear a lightbox to set all the new page measures and naming. By default you will find the project canvas size you have chosen when you create the project.

When you are prototyping for multiple devices, multi-canvas mode is a great feature to track all the results at the same time and to maintain the project consistency.

You can drag & drop to order the project's pages list to have together the pages you want to create in multi devices.

Here you have an example of multi-canvas mode with different page sizes. Thera are two ways to work on this mode:

1- You can select the page on the page manager or clicking in the page you want at the multi-canvas view

2- You can drag & drop elements between the different canvas at multi-canvas view to work with them in more interactive way.
